
Firefox 3.6.3 display problem solved

Author : buildwebsites

I woke to another day of viewing one of my websites totally screwy on the new Firefox 3.6.3 installed yesterday.

I at first assumed it was me, or the CSS, but then had a brainwave.

I searched Google for "firefox website display problem April 2010"

Ah bingo! I am not the only one experiencing this! So I popped over to the Firefox Support page:

<http://support.mozilla.com/en-US/forum/1?openpost=1>

This must be widespread because they already had quick links to solve these issues. I clicked the link to ask a question and was presented with some options.

Ask a new question: Step 1 of 4

To start, choose an option that best describes your question or issue.

- Firefox is having problems with certain web sites
- Firefox is crashing or closing unexpectedly
- I have a problem with my bookmarks, cookies, history or settings
- I have a problem with an extension, plugin or with Thunderbird
- I have feedback about Firefox or would like a new feature
- I have another kind of problem with Firefox

so I clicked the first options and was presented with more choices:

I chose the first one "[websites look wrong](#)", and was taken to this page:

<http://support.mozilla.com/en-US/kb/Websites+look+wrong>

I followed each of the suggestions on this page, and it was CLEARING THE CACHE which solved it for me.

PHEW!!

This is what my website <http://A-Night-in-Paris.com> is supposed to look like (not the one long stream of data without columns I was presented with this morning) - much better!

Glad it's solved

Teena
